2.1.16

(a) Interesting adjoint functors to G-sets.

The trivial group functor I sends a set to a **G**-set with the trivial action $gx = x$. Interesting functors

Orbit functor sends a G-set with underlying set elements a of A to:

$A_G = \{g \cdot a, g \in G\}$

Fixed point functor sends a G-set with underlying set elements a of A to:

$A^G = \{a \text{ such that } g \cdot a = a \text{ for all } g \in G, a \in A\}$

Fixed point functor - right adjoint Morphisms in a G-set are functions on the underlying set, where f commutes with g for every $g \in G$.

There is a bijection for each $A \in \mathbf{Set}$ and $B \in [G, \mathbf{Set}]$ as follows

$$[G, \mathbf{Set}](I(A), B) \to \mathbf{Set}(A, B^G)$$
$$\psi \mapsto \overline{\psi}$$

$\overline{\psi}$ sends each element a of A to $\psi(a)$ if $g \cdot a = a$, otherwise it sends a to $\psi(\emptyset)$.

$$\mathbf{Set}(A, B^G) \to [G, \mathbf{Set}](I(A), B)$$
$$\phi \mapsto \overline{\phi}$$

ϕ sends each $a \in A$ in the underlying set of the G-set to the G-set $(g, \overline{\phi}(a)), g \in G$.

Orbit functor - left adjoint There is a bijection for each $A \in \mathbf{Set}$ and $B \in [G, \mathbf{Set}]$ as follows

$$\mathbf{Set}(A_G, B) \to [G, \mathbf{Set}](A, I(B))$$
$$\psi \mapsto \overline{\psi}$$

So each morphism in **Set** sends the orbit set of an element a of A, call it a_G, to $\psi(a_G)$, where ψ is a function of sets. Set G-set morphism to $\overline{\psi} = \psi$, where $\overline{\psi}$ commutes with g for every g in G.

$$[G, \mathbf{Set}](A, I(B)) \to \mathbf{Set}(A_G, B)$$
$$\phi \mapsto \overline{\phi}$$

Choose $\overline{\phi}$ to be a disjoint union of each orbit of a in A, $\overline{\phi}(a) = \amalg\{\phi(a), g{\cdot}a, g \in G\}$
